

TABLES 1 AND 2

Distinct and Non-Distinct Taxa:

The information in this Appendix is presented in two tables. Table 1 includes what we have termed 'distinct' taxa, that is, those specimens that could be identified to the species level and for which there was sufficient information to be categorized as introduced, cryptogenic or nativeX. Species that could not be identified definitively are listed in Table 2 in this Appendix. Some of the taxa in Table 2 are identified to the genus or a higher taxonomic level, others have been named to the species level but there is still some questions regarding the accuracy of the identification.

Location Categories:

The ports, bays, estuaries and lagoons where species were identified for this study are listed on the following pages in the column headings. These locations are divided into regions that correspond to the 'Major Harbor Areas' referenced in the summary tables in the body of the text of this report. The specific sites included in each of the general regions are highlighted and bracketed across the top of each page.

There are also several catch-all categories. 'CA-Freshwater', 'CA-Coast' and several named counties are used for species identified in the literature without specific location information. For example, some species were listed as being found 'along the California coast', or in 'freshwater areas', or 'north of Humboldt Bay' without indicating where samples were actually collected. Those with some regional description were put into the appropriate county category, those that were more generic were assigned to either 'CA-Freshwater', or 'CA-Coast'. These species are captured in the state-wide summaries but not reflected in the location-specific discussions in the body of the report.

Format:

The location information on the even numbered pages in Table 1, is a continuation of the data for each species that begins on the odd numbered pages.
